*Feedback from French National
Inventory Agency (Citepa)
for N₂O and CH₄ / Jean-Pierre
CHANG*

May 9th -11th , 2022

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 776810

FR-CITEPA FEEDBACK ON N2O AND CH4 / BACKGROUND

Interests of comparing TD vs BU approaches for N2O and CH4

- > N2O from agriculture and CH4 from solid waste : the 2 first key categories of French inventory (tier 2 KC analysis)
- > linked to very high uncertainties for N2O-agriculture soils & CH4-solid waste
- > total uncertainties for N2O 105% and for CH4 41%
- > usefulness to compare and learn from observation-based flux estimates for N2O and CH4

EVALUATION DES SOURCES CLES - ANALYSE EN NIVEAUX D'EMISSIONS TIER 2								
source CITEPA / format CCNUCC - Mars 2022				CITEPA-s_clés_tier2-GES.xlsx/KCA T2 niveau				
Catégorie de source du GIEC / combustible	Gaz	Emissions 2020 kt CO2e	Incertitude émissions (%)	Evaluation du niveau (%)	Total cumulatif	Catégorie clé Tier2 (à 90%)	Catégorie clé Tier1 (à 95%)	
3Da Direct N2O emissions from managed soils	N2O	23 998	146	23,74	23,7	1	5	
5A Solid Waste Disposal	CH4	11 965	176	14,26	38,0	2	10	
3Db Indirect N2O Emissions from managed soils	N2O	5 171	363	12,76	50,8	3	24	
4B2 Land converted to Cropland	CO2	18 340	41	5,10	55,9	4	6	
4B1 Cropland remaining Cropland	CO2	-6 832	100	4,64	60,5	5	20

4A1 Forest Land remaining Forest Land	CO2	-24 144	18	2,95	67,0	7	4	
4C2 Land converted to Grassland	CO2	-7 457	51	2,58	69,6	8	15	
4A2 Land converted to Forest Land	CO2	-7 245	51	2,51	72,1	9	16	
3B Manure Management	N2O	2 350	150	2,39	74,5	10	36	

N₂O AND CH₄ - TD VS BU VERIFY SYNTHETIC PLOTS

FR-CITEPA FEEDBACK ON N₂O AND CH₄ / MEAN FLUX

Mean data over a comparison period :

-> Quite comparable and consistent results (using the global median inversion) between TD and BU approaches:

- 8% difference for N₂O (2005-2014)

- 6% for CH₄ (2010-2016)

-> interesting QAQC support for the national inventory agencies

-> verification and confirmation of relatively good reliability of FR N₂O & CH₄ inventories in mean emissions level.

-> good overlap of uncertainties from both TD & BU approaches for N₂O, and a partial overlap for CH₄.

FR-CITEPA FEEDBACK ON N₂O AND CH₄ / INTERANNUAL VARIATION

Interannual variation - TD inverse models vs BU inventory:

- > Not comparable interannual variations.
- > Interannual variation: low in inventory versus large in inverse models.
- > IPCC equations do not include interannual meteorological sensitivity (but possible average climate regional types).
- > But such comparison is useful to reveal the cases where inventories do not reflect interannual fluctuations (e.g. from biogenic sources).
- > For N₂O: good overlap of uncertainties (TD & BU), linked to large uncertainty in N₂O inventory.
- > For CH₄: only partial overlap of uncertainties (TD & BU). Inventory experts would expect less interannual variation.

FR-CITEPA FEEDBACK ON N₂O AND CH₄ / TREND

Trend comparison - TD inverse models vs BU inventory:

- > N₂O inventory -> global decreasing trend (-13% from 2005 to 2014), VS different trends from inverse models (from -26% to +51%).
- > CH₄ inventory -> global decreasing trend (-6.5% from 2010 to 2016), VS different trends from inverse models (decreases and increases).
- > So, no usefulness of TD trend results for verification of inventory trends
- > Need for further investigations on trend of TD approaches and further understanding of the differences between TD models.

FR-CITEPA FEEDBACK ON N₂O AND CH₄ / SUMMARY

TD inverse models vs BU inventory: summary and perspectives for N₂O & CH₄

- > An actual need for such comparisons/verifications taking into account large uncertainties of national inventories for N₂O and CH₄.
- > Quite comparable results with mean emission level: so usefulness of TD approaches for verification of inventories for mean level.
- > Strength of the TD approach to reveal actual interannual sensitive variations of emissions (e.g. due to meteorological conditions / biogenic emission sources).
- > Different trends according to different TD models: need for further investigations/developments of the TD approach for more consistent trend assessment, before using it for verification of inventory trends.

THANK YOU FOR ATTENTION
